

# Main characteristics of the Human Respiratory Tract Model (HRTM) used in the OIR and EIR series

---

TG 95 Webinar

Internal Dose Coefficients for Workers and  
Members of the Public

6 December 2023

Demetrio Gregoratto

# Revision of the Human Respiratory Tract Model (HRTM)

**ICRP 66 (1994)**

**ICRP 130 (2015)  
Annex A**

# Scope of the HRTM

**HRTM: Quantitative description of the respiratory tract as a route of entry of radionuclides to the body.**

- Calculating activity distribution and retention in RT regions (lungs monitoring)
- Calculating doses to RT target tissues (absorbed and equivalent doses)
- Aerosol particle sizes 0.001 – 20  $\mu\text{m}$ , gases and vapours
- For workers and members of the public. One Reference Individual for each age-group:  
3-months, 1-, 5-, 10- and 15-y old children and adult (worker and public).

# Respiratory tract regions

## Extrathoracic airways

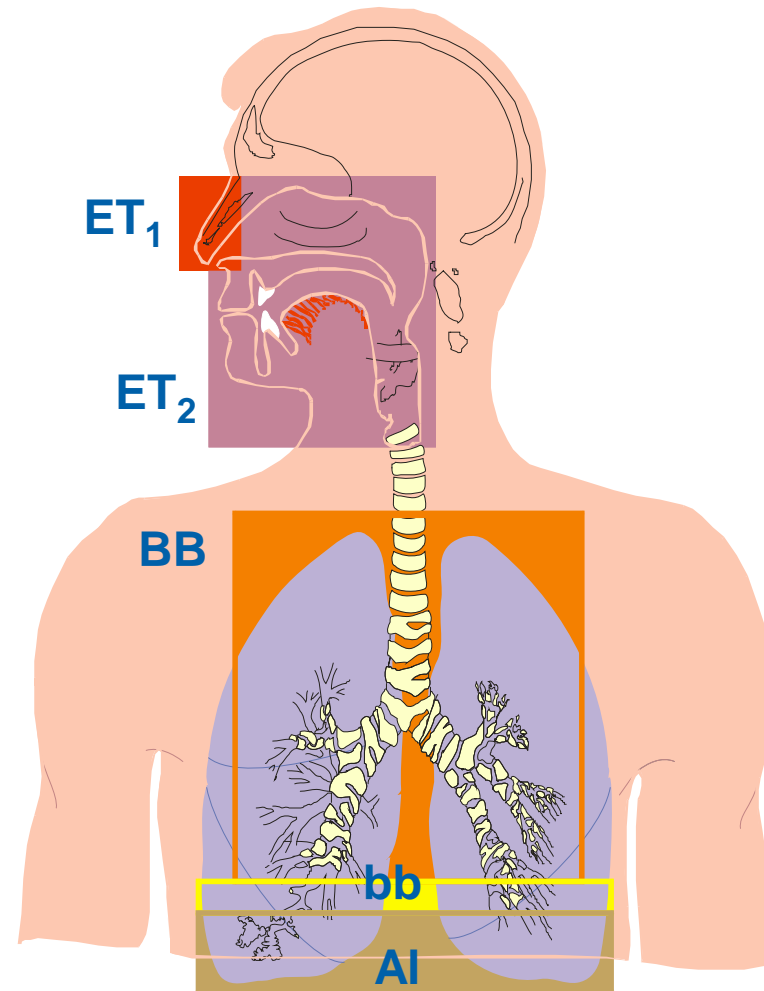

ET<sub>1</sub>: anterior nasal passages

ET<sub>2</sub>: posterior nasal passages, pharynx and larynx

## Bronchial

## Bronchiolar

## Alveolar interstitial

# Particle deposition in respiratory tract

## Total and regional deposition

fraction(s) of the intake deposited in the respiratory tract (regions)

### Anatomical and physiological parameters

- dimensions of respiratory tract
- ventilation rate, breathing frequency
- fraction breathed through nose

### Aerosol parameters

- particle size distribution (AMAD or AMTD,  $\sigma_g$ )
- particle density and shape factor

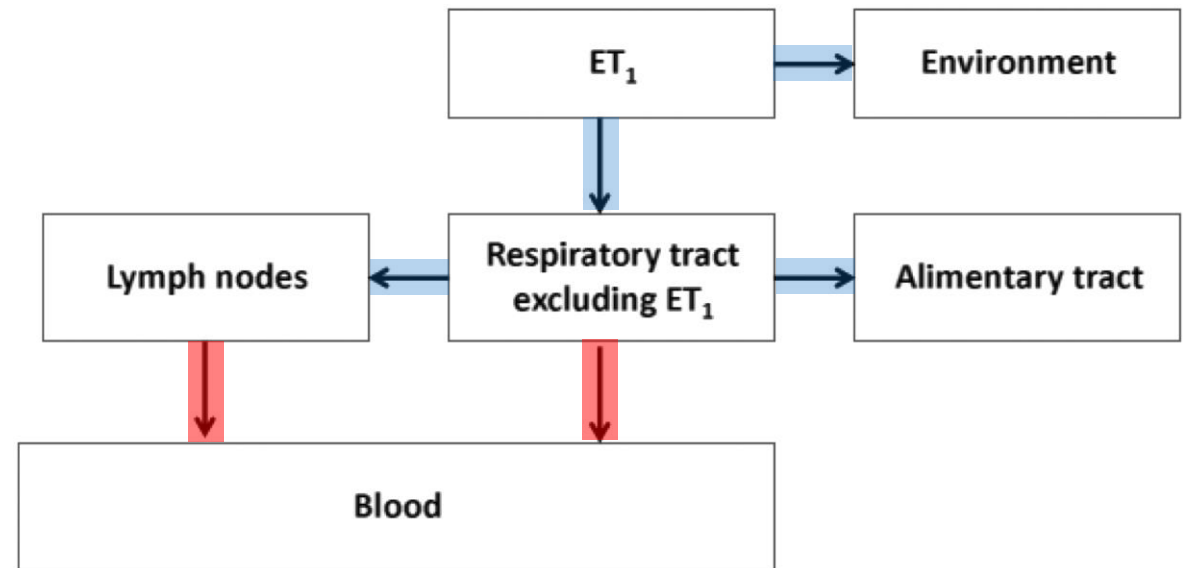

Exposure	AMAD ( $\mu\text{m}$ )
Occupational	5
Environmental	1

Exception: short-lived progeny of radon (ICRP137, OIR P3)

# Clearance model for the respiratory tract

## Simplifying modelling assumptions

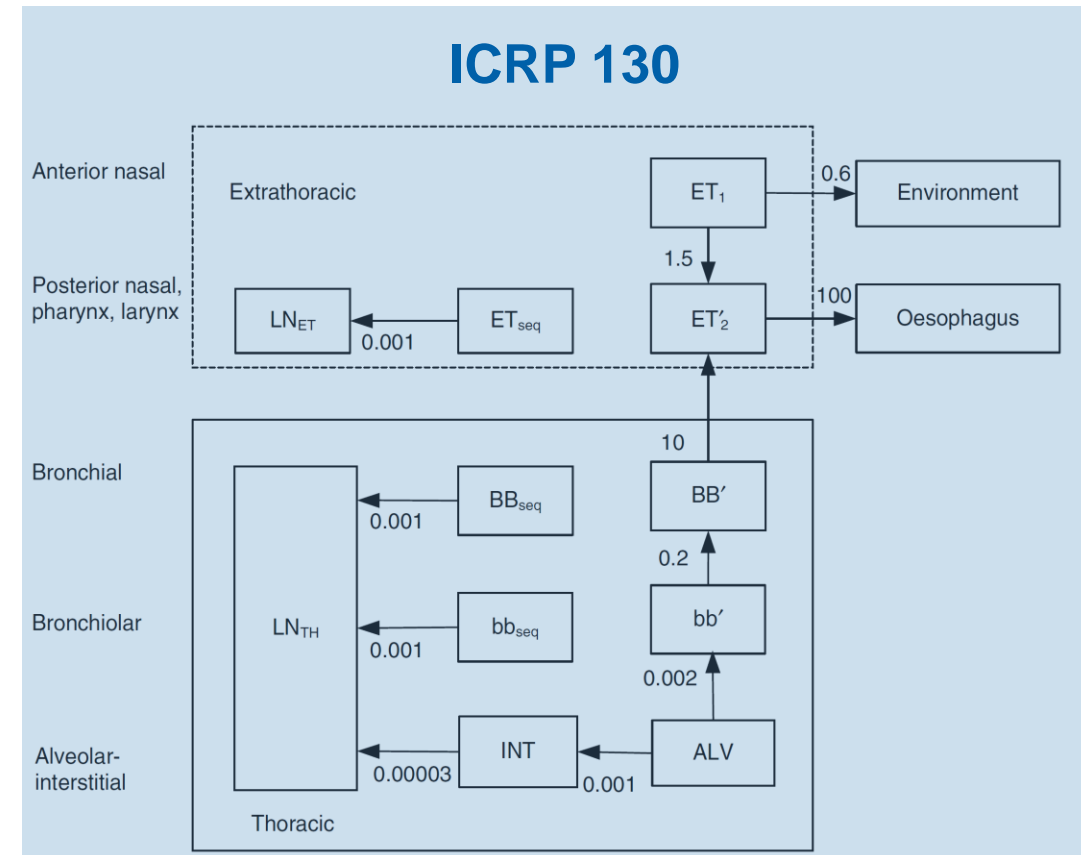

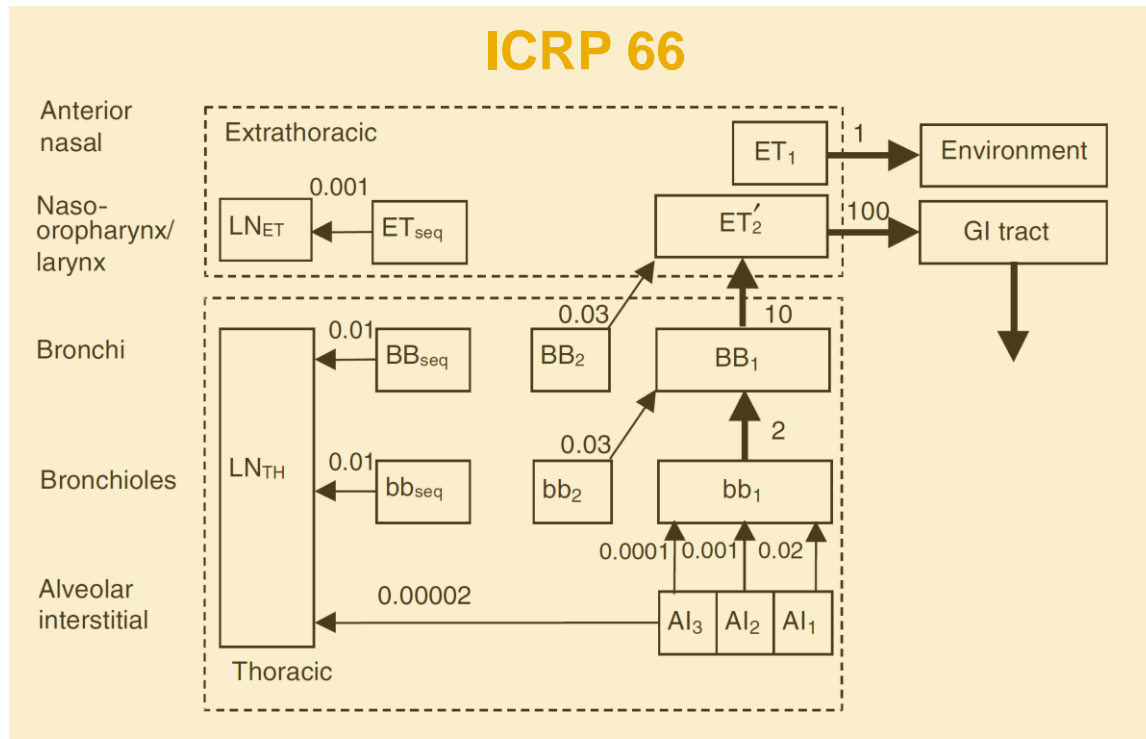

- Two independent mechanisms:
  - **particle transport**
  - **absorption into blood**
- Independent of age and sex
- Particle transport same for all materials
- Absorption same in all regions except ET1
- Compartmental model with constant rates

# Clearance by particle transport

## Revision of particle transport

- Simplified model structure
- changes to transport rates ( $d^{-1}$ )

# Clearance by particle transport: Extra-thoracic regions

## ICRP 66

## ICRP 130

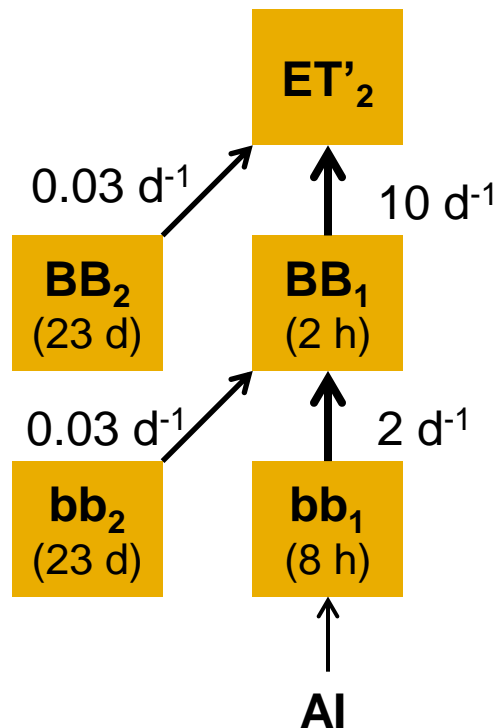

- May increase dose coefficients
  - greater systemic uptake from  $ET_2$  and alimentary tract
- Monitoring of faecal samples:
  - increased clearance to alimentary tract (~ 80% ET deposit)

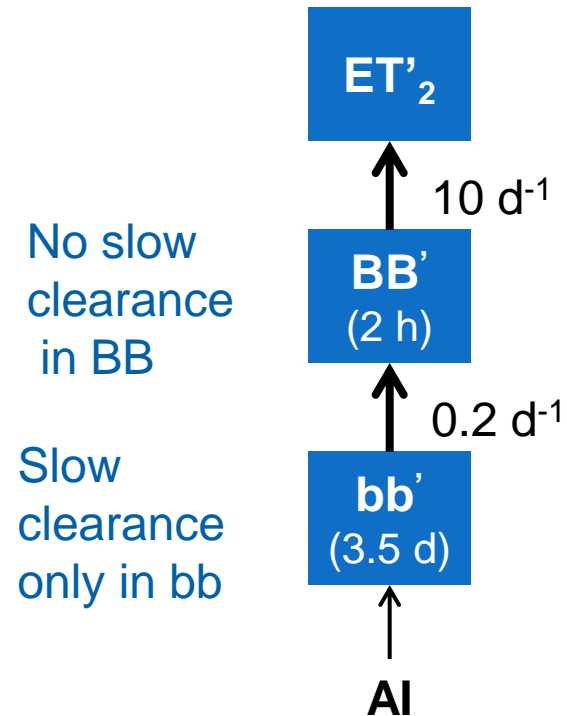

# Clearance by particle transport: Bronchial and bronchiolar regions

## ICRP 66

## ICRP 130

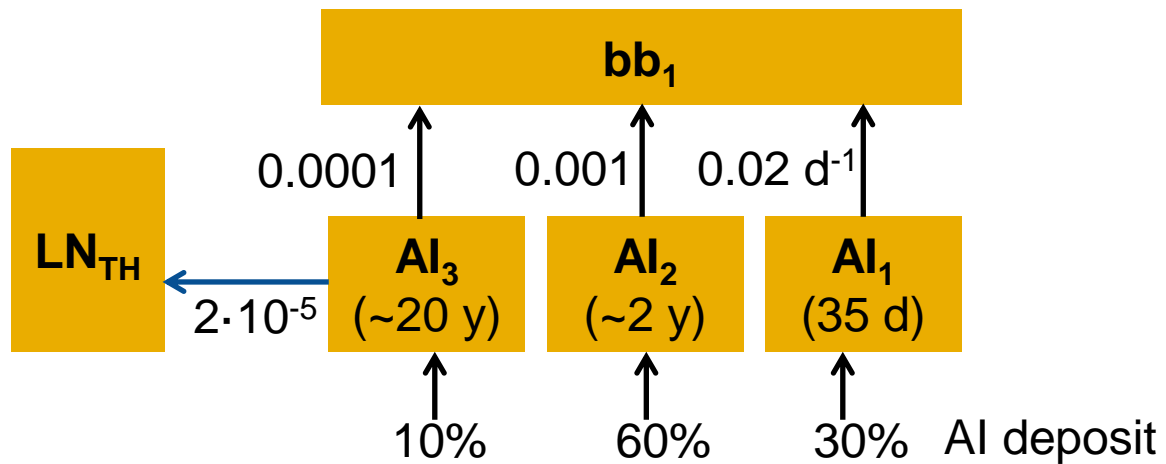

## Decreased lung dose

for moderately soluble materials  
of alpha emitters with radioactive  
half-lives of weeks or more

# Clearance by particle transport: alveolar-interstitial region

## ICRP 66

## ICRP 130

- Greater retention in Al region for insoluble particles
- About 33% of the alveolar deposit is sequestered in the interstitium (for insoluble particles)
- Lung doses 50–100% higher for insoluble materials of long-lived  $\alpha$ -emitters, little effect on more soluble forms.

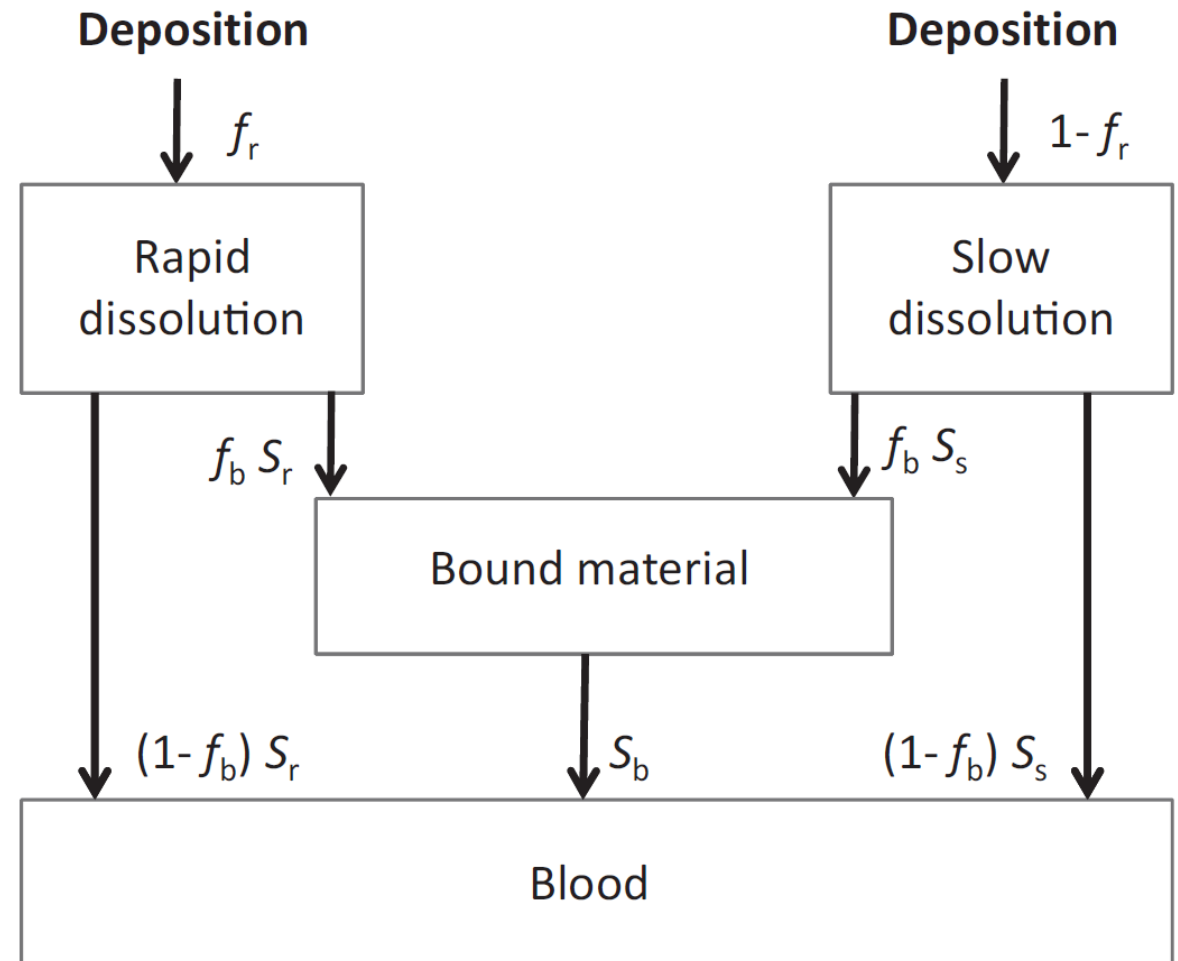

# Clearance: absorption into blood

Depends on the physical and chemical form

Same rates in each RT regions, except  $ET_1$

Two stages: dissolution + uptake to blood

Bound material not subject to particle transport

# Clearance: absorption into blood

**Review** of experimental data (in vitro, in-vivo)  
to derive absorption characteristics of inhaled materials

- update default values for three types of materials:  
Type F (fast), M (moderate) and S (slow)

Where sufficient information (limited set) adopt

- material-specific values
- element-specific values for bound state
- element-specific values for rapid absorption rate in soluble materials

# Clearance by absorption to blood: default Types (F,M,S)

## ICRP 66

## ICRP 130

Absorption Type		F (fast)	M (moderate)	S (slow)	F (fast)	M (moderate)	S (slow)
Fraction dissolved rapidly	$f_r$	1	0.1	0.001	1	0.2	0.01
Rapid dissolution rate ( $d^{-1}$ )	$S_r$	100	100	100	30	3	3
Slow dissolution rate ( $d^{-1}$ )	$S_s$	-	0.005	0.0001	-	0.005	0.0001

**Bound state** not included in default types F, M and S

### Changes to $f_r$ and $s_r$ values

reduce rapid absorption in the ET airways and increase in the lungs.

# Deposition and clearance of gases and vapours

The ICRP-66 classification **SR-0**, **SR-1**, **SR-2** not been found helpful and no longer used.

**Type V** (very fast): Instantaneous uptake into blood has also been recommended.

## Revised default

100% deposition and Type F absorption.

## Deposition (%)

	Default		HTO	I <sub>2</sub>	Hg
<b>Tot</b>	100		100	100	80
<b>ET1</b>	0		0	0	0
<b>ET2</b>	20		20	50	2
<b>BB</b>	10		10	50	1
<b>bb</b>	20		20	0	2
<b>AI</b>	50		50	0	75
<b>Type</b>	F		V	F	F

# Revised HRTM

## **Description of the revised HRTM model in**

- ICRP Publication 130, OIR Part 1, Introduction and **Annex A**.
- ICRP Publication xxx, EIR Part 1, Introduction

## **Absorption parameter values for each element**

- OIR Part 2-5
- EIR Part 1-3

# ICRP

Thank you.

[www.icrp.org](http://www.icrp.org)

# Absorption to blood: element-specific parameters

## Rapid absorption rate, soluble forms (Type F)

$S_r$	Elements
100	H, C, Fe, Tc, I, Cs, Pb
70	Ca
50	Te, Th, Pa
20	Ba
10	Ra, U
3	Po, Ni
1	P, Co, Y, Bi, Ag, all lanthanoids
0.4	Ac, Pu, all trans-plutonium

$s_r$  values also used for Type M and S if less than 3 d<sup>-1</sup>.

## Bound fraction and uptake rate

	$f_b$	$s_b$ (d <sup>-1</sup> )		ET <sub>2</sub>	BB, bb	AI
<b>Co</b>	0.03	0.002				X
<b>Ru</b>	0.05	0.1		X	X	X
<b>Ce*</b>	0.07	0.02		X		X
<b>Hg</b>	0.24	2.1		X	X	X
<b>Pb</b>	0.5	1.7		X	X	X
<b>Pu*</b>	0.002	0.		X	X	X

Applied to conducting airways (ET<sub>2</sub>, BB and bb) **only if** supporting experimental evidence (autoradiography, autopsy data).
