CONTENTS

1. Justification of medical exposures.
   a) Low priority promoting and funding education and training programmes in RP for the health sector?.
   b) New versus old technology in imaging and therapy.

2. Optimization of medical (and occupational) exposures.
   a) Practices with ionizing radiation in Medicine without the necessary support of Medical/Health physicists?.
   b) When to move from old to new technology in imaging and therapy systems?.

3. Should we accept the work in radiology without enough quality control (quality assurance) and without patient dose evaluations (including the use of DRLs)?

4. Interpreting the new European BSS Directive under the ethical perspective.
ICRP formed in October 2013, the TG 94 on “Ethics of Radiological Protection”

ICRP TG 94 Members (as listed at ICRP web site on 27 January 2015):
Deborah Oughton (Chair, Norwegian University of Life Sciences); Marie-Claire Cantone (University of Milan, Italy); Kun-Woo Cho (KINS, Korea);
Sven Ove Hansson (Royal Institute of Technology, Sweden); Chieko Kurihara-Saio (NIRS, Japan); Thierry Schneider (CEPN, France); Richard Toohey (HPS, USA); Sidika Wambani (Kenyatta National Hospital, Kenya);
Friedo Zölzer (University of South Bohemia, Czech Republic).

Corresponding Members: Ms Renate Czarwinski (IRPA); Emilie van Deventer (WHO); Bernard Le-Guen (IRPA).

JUSTIFICATION OF MEDICAL EXPOSURES
One of the major ethical problems in radiology is justification of medical exposures in practice.

• There is a significant level of inappropriate usage, and, in some cases, a poor level of awareness of dose and risk among some key groups involved.
• There is a need for improved communication, both within professions and between professionals on one hand, and between professionals and the patients/public on the other.
• The need for good evidence-based referral guidelines or criteria of acceptability.
• Scandinavian audits have demonstrated a generally high rate, approximately 20% or over, of inappropriate or unnecessary examinations, and a very high rate, up to 77%, in the case of some specific examinations.

• In paediatrics, a recent straw poll among specialist radiologists suggested that up to 30% of CT examinations may be inappropriately undertaken.

• Conclusion: justification would be facilitated by the “3 As”: awareness, appropriateness and audit.

*Average background radiation is 2.2–2.4 mSv per year.
†These examples relate to a 50-year-old man. Multiply by 1.38 for women, by 4 for children under 1 year of age, and by 0.5 in an 80-year-old man.
▲ <1 mSv, ▲ ▲ 1–5 mSv, ▲ ▲ ▲ 5–10 mSv, ▲ ▲ ▲ ▲ ▲ >10 mSv.

New Directive 2013/59/EURATOM. Art. 57 Responsibilities:
(d) wherever practicable and prior to the exposure taking place, the practitioner or the referrer, as specified by Member States, ensures that the patient or their representative is provided with adequate information relating to the benefits and risks associated with the radiation dose from the medical exposure.
The European Society of Radiology considers referral guidelines for medical imaging essential for improving appropriateness and justification of radiological procedures.

Particularly at a time of increasing financial pressure on European healthcare systems and public concerns about the risks of exposure to radiation.

The ESR is developing ESR iGuide, a clinical decision support (CDS) system for European imaging referral guidelines.

Example: Diagnostic Imaging Pathways (DIP)
– www.imagingpathways.health.wa.gov.au
Electronic request/decision support tool
ARE THE ICRP RECOMMENDATIONS CONSIDERED WHEN INTRODUCING NEW CLINICAL PROCEDURES?

ICRP Publication 103 (paragraph 209) states:

- The medical use of radiation should be justified, as is any other planned exposure situation, although that justification lies more often with the profession than with government or the competent regulatory authority.
- The principal aim of medical exposures is to do more good than harm to the patient, due account being taken of the radiation detriment from the exposure of the radiological staff and of other individuals.
ETHICAL ASPECTS IN JUSTIFICATION OF IMAGING … SOME ADDITIONAL ASPECTS

- Appropriate imaging in Medicine vs. Business in Medicine.
- Public Medicine vs. Private Medicine.
- Education in RP (for referrers and practitioners) including proper information for patients.
- Justification: could it be used "to reduce waiting lists" in some hospitals?.
- Is it considered the technology and expertise available in that Centre?.
- Are the previous images and clinical reports available?.
- Are the hospitals updating the technology and networks for the access of previous images?

DOLIR (Dose On Line in Interventional Radiology)
Coordinated by the San Carlos University Hospital in Madrid

Are the previous images and clinical reports available?

- 9 Cardiology labs
- 5 Vascular labs
COMPARISON OF CUMULATIVE AIR KERMA (CAK) (UPPER GRAPH) AND LIFE CAK (LOWER GRAPH) CORRESPONDING TO THE SAME PATIENTS. NOTE AS INDICATED WITH AN ARROW A PROCEDURE WITH LESS THAN 4 GY IN CAK AND NEARLY 10 GY WITH LIFE CAK

OPTIMIZATION OF MEDICAL (AND OCCUPATIONAL) EXPOSURES
**ETHICAL ASPECTS IN OPTIMIZATION DURING MEDICAL PROCEDURES ... ADDITIONAL ASPECTS**

- Doing procedures without the appropriate technology (considering patient and staff dosimetry).
- Doing procedures without the required support of trained radiographers and medical physicists.
- Doing complex procedures without the necessary expertise.
- Protection of patients vs. protection of staff.
- Criteria to decide if some procedures should be done by senior staff or by residents.
- Doing procedures without the proper occupational protection (and training in RP) of all the staff involved in the procedures (e.g. hybrid catheterization rooms).

**ARE THE ICRP RECOMMENDATIONS CONSIDERED WHEN INTRODUCING NEW CLINICAL PROCEDURES?**

ICRP Publication 105 (paragraph 69) states:

- **Optimization (medical).** The choice of protection option directly alters the level of exposure of the patient, the staff, and sometimes the public. However, the choice also alters the scale of resources applied to protection. These resources may be reflected directly in financial costs, but they may also involve less easily quantified societal costs such as other health risks to staff.
Staff doses and scatter dose rates now available in real time

Staff doses in real time
Cardiologist 40 µSv. High dose rate at the C-arm for a cardiology laboratory 105 mSv/h (accumulated at the C-arm: 1553 µSv). 10 µSv/Gy.cm²

Abdominal procedure 298 Gy.cm² ; 7.2 µSv/Gy.cm²

C-arm dosimeter: 2164 µSv

Scatter dose rate: 280 mSv/h
Ethical aspects in the case of unintended medical exposures (1)

- Unintended exposure: means medical exposure that is significantly different from the medical exposure intended for a given purpose (2013/59/Directive).
- Specially relevant for Radiotherapy and Interventional procedures.
- During interventional procedures, there is sometimes, a lack of knowledge of the level of skin doses and their biological effects.
- High occupational (lens) doses may also occur for some health professionals during these procedures.
ETHICAL ASPECTS IN THE CASE OF UNINTENDED MEDICAL EXPOSURES (2)

- Control of patient doses during the procedures?.
- Knowledge of the trigger levels for potential radiation injuries and clinical follow-up?.
- Is it a system for reporting and alerting on patient doses?.
- Is it available the information (clinical and dosimetric) from previous procedures?.
- Enough knowledge of dose reduction possibilities of the used X-ray system?.
- Enough support from medical physicists and trained radiographers?.
- Quality Control of the X-ray system and updated Quality Assurance programme?.

ICRP REPORT 85 (2001): AVOIDANCE OF RADIATION INJURIES FROM INTERVENTIONAL PROCEDURES

Photograph of the patient’s back 21 months after a coronary angiography and two angioplasty procedures within three days; the assessed cumulative dose was 15 - 20 Gy
Posterior subcapsular lens changes characteristic of ionizing radiation exposure were found in 50% of interventional cardiologists and 41% of nurses and technicians compared with findings of similar lens changes in < 10% of controls. Most lens injuries result after several years of work without eye protection.

J Vasc Interv Radiol 2013;24:197–204
QUALITY CONTROL / QUALITY ASSURANCE PROGRAMMES AND DIAGNOSTIC REFERENCE LEVELS

ETHICAL ASPECTS AND QUALITY ASSURANCE PROGRAMMES

- If acceptance and constancy tests are not carried out, patients could receive unnecessary doses or bad image quality could be obtained.
- Initial training and regular re-training in RP shall be included.
- Audit of the appropriateness of the request for radiological procedures.
- Patient dose records and transfer to the clinical reports.
- System to detect accidental and unintended exposures and clinical follow-up of high doses.
- Optimization actions and use of DRLs.
THE NEW EUROPEAN BSS DIRECTIVE UNDER THE ETHICAL PERSPECTIVE

ASPECTS REQUIRED BY THE NEW EUROPEAN DIRECTIVE ON BSS AND ETHICAL APPROACH

- BSS Directive 2013/59/Euratom
  - New dose limit for the lens of the eyes.
  - Consideration of occupational doses in justification and optimization.
  - Use of diagnostic reference levels and regular review.
  - Role of Medical Physics Expert in imaging.
  - Dosimetric information in all diagnostic systems and transfer to the patient report.
  - Registry and analysis of the accidental or unintended irradiation of patients.

- Good ethical approach
  - Anticipated evaluation and need of additional dosimetry
  - Knowledge of ranges of occupational dose values.
  - Knowledge and use of DRLs and regular audit of patient doses.
  - Availability of MPEs.
  - Manual-automatic and included in technical specifications.
  - Local records and analysis.
