

# How the new “Derived Consideration Reference Levels” were derived

## Why and how they are useful

---

Jacqueline Garnier-Laplace, ICRP & ASNR, France

TG99 virtual workshop, 26 June 2025

INTERNATIONAL COMMISSION ON RADIOLOGICAL PROTECTION

# Structure of the TG99 report

Abstract .....	→	4¶
MAIN POINTS .....	→	6¶
1. → WHY THIS PUBLICATION? .....	→	7¶
2. → BACKGROUND .....	→	9¶
2.1. Setting the scene: key elements of the Commission's approach to radiological protection of the environment .....	→	9¶
2.2. Practicality of RAPs .....	→	10¶
2.3. Rationale and benefits of a broadened RAP approach .....	→	11¶
2.4. Objectives, methods and outcomes .....	→	11¶
2.5. Structure of the publication .....	→	12¶
3. → ELEMENTS OF THE REFERENCE ANIMALS AND PLANTS APPROACH .....	→	14¶
3.1. Practical use of RAPs: enhancing robustness and flexibility .....	→	14¶
3.2. Basis for implementing the RAP approach .....	→	16¶
4. → COMPILATION AND SUMMARISATION OF EFFECTS OF IONISING RADIATION IN SUPPORT OF THE BROADENED RAP APPROACH .....	→	18¶
4.1. Comparative analysis of radiosensitivity between species and endpoints .....	→	18¶
4.2. Update of effects data .....	→	18¶
4.3. Derivation of DCRLs for chronic exposure .....	→	19¶
4.4. Endpoints Sensitivity Distributions for Acute Exposures .....	→	27¶
4.5. Comparison of the outcomes of the proposed and existing approaches to derive DCRLs .....	→	30¶
4.6. Simple guidance on using DCRL <sub>Family</sub> and higher taxonomic level DCRLs in conjunction .....	→	33¶

5. → REVIEW OF THE ADDITIONAL DCRL VALUES RELATED TO THE BROADENED RAP APPROACH .....	→	35¶
5.1. Comparison with laboratory chronic effects data not used to derive the DCRLs .....	→	35¶
5.2. Comparison with field data from sites contaminated by radionuclides .....	→	36¶
5.3. Extrapolation issues and research needs .....	→	37¶
6. → CONCLUDING REMARKS .....	→	39¶
REFERENCES .....	→	40¶
ANNEX A. → PUBLICATIONS USED IN SUPPORT OF PUBLICATION 108, IN ITS ANNEX D. RADIATION EFFECTS IN REFERENCE ANIMALS AND PLANTS .....	→	45¶
A.1. References .....	→	52¶
ANNEX B. → LOGIC DIAGRAM TO RECONSTRUCT DOSE (RATE) – EFFECT RELATIONSHIPS FOR EXPERIMENTS DESCRIBED IN FREDERICA .....	→	62¶
ANNEX C. → THE TWO STATISTICAL MODELS USED IN THE NEW METHODOLOGY TO DERIVE ADDITIONAL DCRLS .....	→	63¶
C.1. Species and Endpoints Sensitivity Distributions .....	→	63¶
C.2. Inferring chronic effects from data for acute exposures .....	→	64¶
C.3. References .....	→	65¶
ANNEX D. → POTENTIAL APPLICATION OF THE BROADENED RAP APPROACH .....	→	66¶
ABBREVIATIONS .....	→	69¶
GLOSSARY .....	→	70¶
ACKNOWLEDGEMENTS .....	→	71¶

# Brief reminder of the current RAP approach (P108)

- **Demonstration of protection of non-human species is:**

- generally targeted at the **population level** (or higher levels), rarely at the individual (except for species at risk)

- based on:

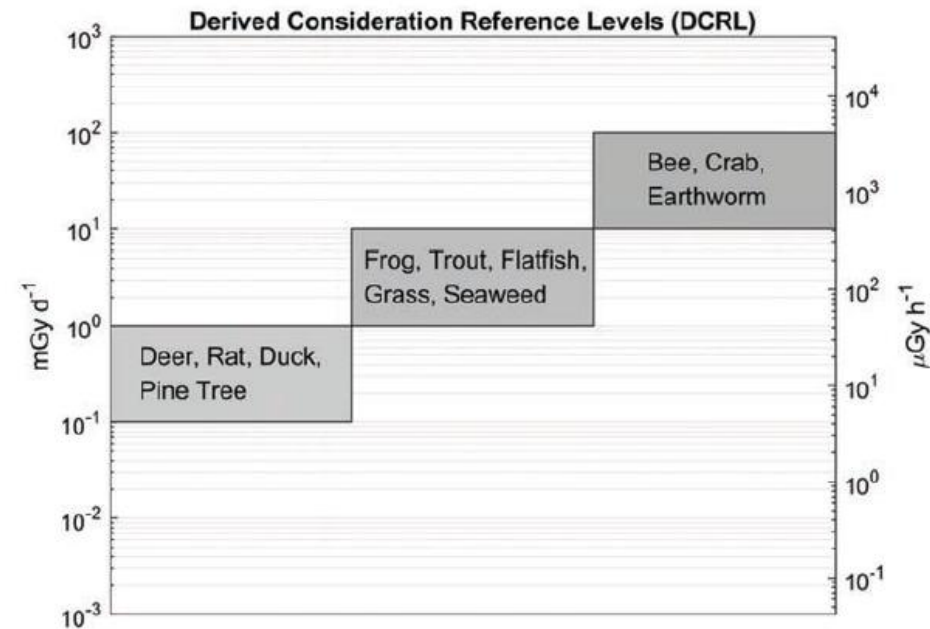

- **A set of 12 Reference Animals and Plants (RAPs), defined at the Family level**

(Species < Genus < **Family** < Order < Class < Phylum < Kingdom)

- **RAP-related Derived Consideration Reference Levels (DCRLs)** as benchmark for comparison with dose rate estimates and assess radiological impact

*“DCRLs are ranges of dose rates where some deleterious effects may be expected and which are defined as benchmarks for assessing radiological impact to non-human species, either actual or potential.”*

Dose rate (mGy/d)			
0.1 - 1	Very low probability of effects	Very low probability of effects	No information

*“Revisions will need to be made as more data become available.” P108 (published in 2008, with literature review until ~2006)*

# Broadening the RAP approach

## What it means

Complementing the current set of RAP<sub>Family</sub> with additional RAPs (and DCRLs) representing **higher taxonomic levels – class or phylum, non-human species groups**

## How it was implemented

By pooling comparable effects data across taxa to enable **statistical analysis of the radiosensitivity variation among species within the same taxonomic level** (e.g., class)

RAP <sub>Class (or Phylum)</sub> Common name	Scientific name (class or phylum)	RAP <sub>Family</sub>
Birds	<i>Aves</i> <sup>†</sup>	Duck
Fish	<i>Actinopterygii</i> <sup>†</sup>	Trout; Flatfish
Mammals	<i>Mammalia</i> <sup>†</sup>	Deer; Rat
Crustaceans*	<i>Branchiopoda</i> <sup>†</sup> , <i>Malacostraca</i> <sup>†</sup>	Crab
Worms*	Annelida* ( <i>Clitella</i> <sup>†</sup> and <i>Polychaeta</i> <sup>†</sup> )	Earthworm
Insects	<i>Insecta</i> <sup>†</sup>	—
Conifers	<i>Pinopsida</i> <sup>†</sup>	Pine tree
Grasses and monocots <sup>†</sup>	<i>Liliopsida</i> <sup>†</sup>	Wild grass
Shrubs, trees not coniferous, dicots <sup>†</sup>	<i>Magnoliopsida</i> <sup>†</sup>	—
<b><u>Broad non-human species groups</u></b>		
Vertebrates		Frog <sup>§</sup> ; Mammals; Fish; Birds
Invertebrates		Bee <sup>§</sup> ; Earthworm; Crab
Plants		Brown seaweed <sup>§</sup> ; Pine tree; Wild grass

\*Phylum. <sup>†</sup>Class. <sup>§</sup>RAP<sub>Family</sub> with no existing effects data.

# Methodology of effects data treatment

Chap 4.1 to 4.3

Select QC data for each test  
[series of data pairs for (species,  
endpoint, exposure conditions)]

[www.frederica-online.org](http://www.frederica-online.org)

(> 1500 references; 26 000 data entries –  
version 2010 – complemented by references  
reviewed under the IAEA EMRAS programme)

Copplestone et al., JER 2013  
Garnier-Laplace et al., JER 2010

Reconstruct dose(rate)-effect  
relationship for each test

Chronic test – Observed  $EDR_{10}$   
Acute test -- Observed  $ED_{50}$

Develop the Acute-to-Chronic  
Transformation of Radiation effects  
(ACTR) model

Beaugelin-Seiller et al., EST 2021

Establish Endpoint Sensitivity  
Distribution (ESD) per taxonomic group

Chronic ESD [ $EDR_{10}$  observed and predicted]  
Acute ESD [ $ED_{50}$  observed]

DCRL derivation per taxonomic  
group

Real and Garnier-Laplace, JER 2020

# Interpretation of ESD and derivation of DCRLs

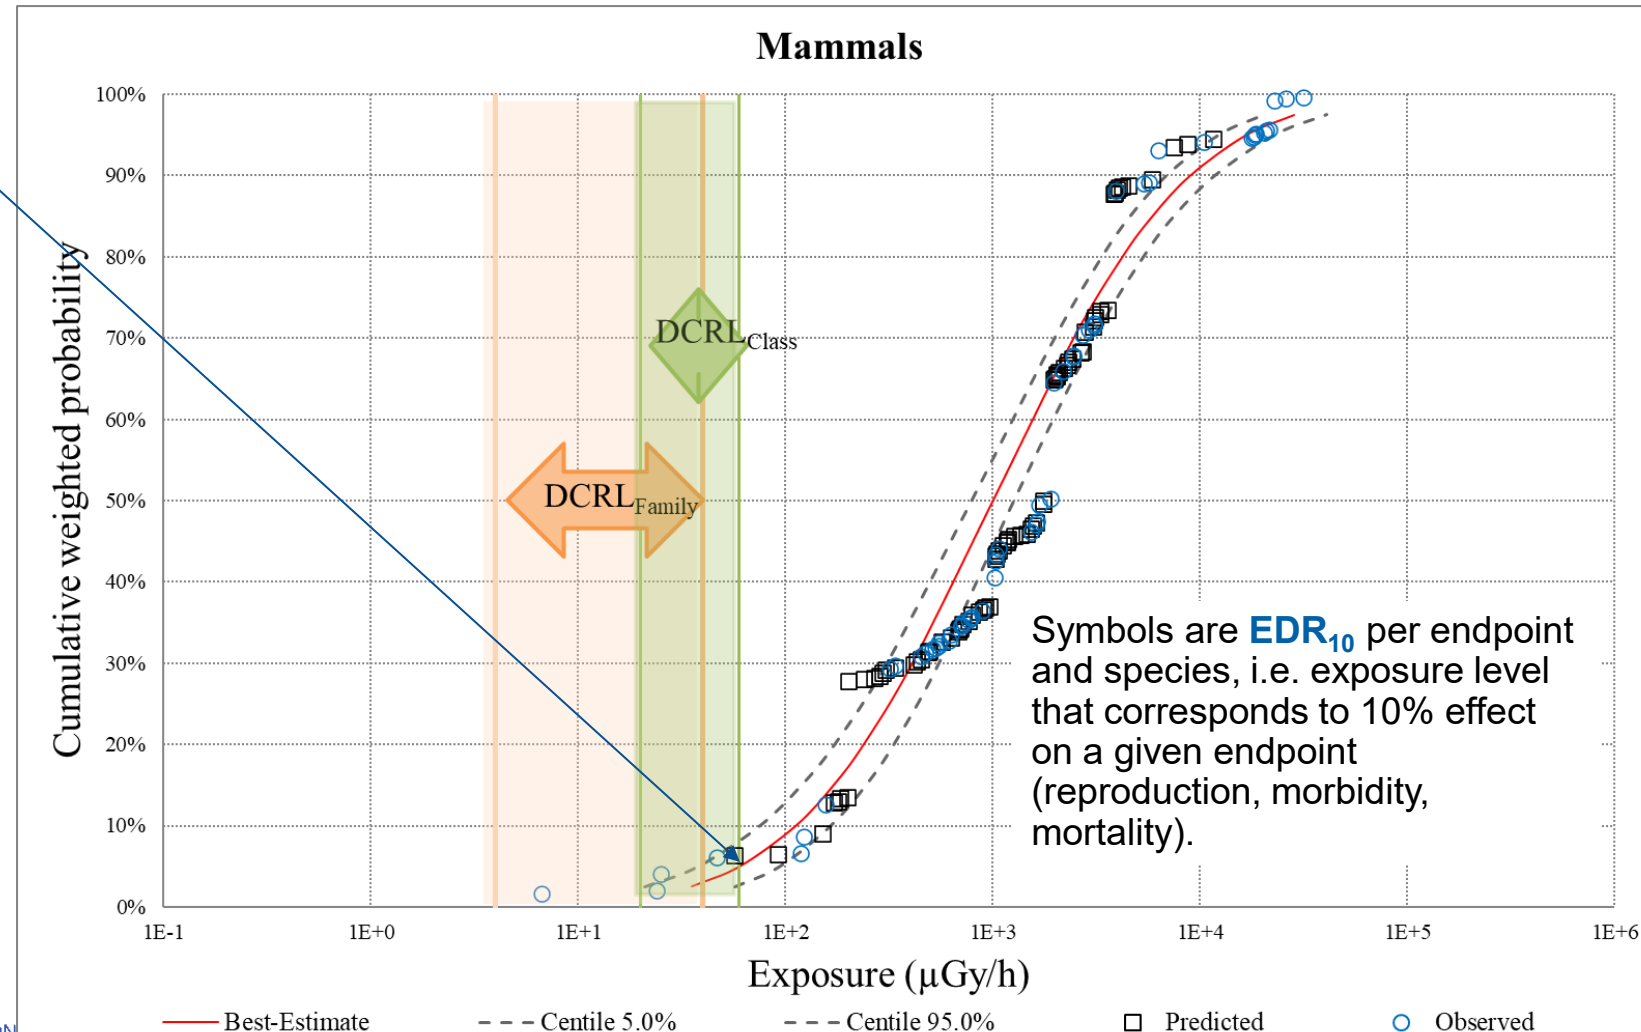

- **DCRL derivation**

Upper boundary = **best estimate of 5<sup>th</sup> percentile**

Lower boundary = **upper bound divided by an Extrapolation Factor (EF)** accounting for the quality of the dataset

- **Semi-quantitative assessment of the quality of the data set to define EF**

Criterion\level of uncertainty
(low-intermediate-high)
#1. Total number of data
#2. Observed data proportion
#3. Reproductive endpoints proportion
#4. Ratio of observed data below 5th
#5. Number of species
TOTAL SCORE
EF= from 1 (low) to 5 (high)

# Comparison of DCRLs (families vs. higher taxonomic groups)

Chap 4.5 (Tab4.7; Tab 4.8)

- The two approaches used to determine DCRLs do not result in major differences to their values (**ca. one order of magnitude**)
- Lower boundary values of **DCRL<sub>Class or Phylum</sub>** or **broad groups** are generally higher than **DCRL<sub>Family</sub>** values.

## Exceptions:

Lower DCRL<sub>Class or Phylum</sub> or broad groups than their corresponding DCRL<sub>Family</sub>  
*more effects data and statistical analysis reduce uncertainty in DCRL<sub>Class or Phylum</sub> or broad groups estimates for invertebrates.*

Dose rates in  $\mu\text{G/h}$

### P108

Expert judgement based on critical literature review  
 Band of one order of magnitude

RAP <sub>Family</sub>	DCRL <sub>Family</sub>
<i>duck</i>	4-40
trout; flat fish	40-400
deer; rat	4-40
<i>frog</i>	40-400
<i>bee</i>	400-4000
<i>crab</i>	400-4000
earthworm	400-4000
<i>pine tree</i>	4-40
<i>wild grass</i>	40-400
none	—
brown seaweed	40-400

### This Publication

5<sup>th</sup> percentile of the ESD per group and Extrapolation Factor to define the lower boundary

EF from 3 to 5

EF fixed at 10

RAP <sub>Class or Phylum</sub> *	DCRL <sub>Class or Phylum</sub>	Broad groups
Birds	100-300	Vertebrates
Fish	70-200	10-100
Mammals	20-60	
Amphibians	No data	
Insects	No data	Invertebrates
<i>Crustaceans</i> *	100-400	70-700
Worms*	100-500	
<i>Conifers</i>	70-300	Plants
<i>Grasses and Monocots</i>	200-1000	60-600
Shrubs, Trees not coniferous, Dicots	200-600	
Brown Algae	No data	

# Simple guidance on using DCRL<sub>Family</sub> and higher taxonomic level DCRLs in conjunction

Chap 4.5

- DCRL<sub>Family</sub> (from P108) are the **benchmarks recommended for environmental impact assessments**.
- The additional DCRLs at higher taxonomic levels provide an **important complement for assessing environmental impact in complex cases**
  - Enable more refined assessments along with a transparent evaluation of the level of confidence in the assessment conclusions (e.g., consider uncertainties when selecting which values to apply)
  - Option to derive **site-specific DCRLs** by using case-specific effects data or adjusting the level of protection
- Irrespective of the DCRLs used, **guidance from Publication 124 applies**.
- For early stage of an emergency: option to use acute ESD models per class, phylum or broad groups **retrospectively to support dialogue with stakeholders on any ecological impacts that may have occurred**

# User-oriented concluding points

Chap 6

- There is **reasonable confidence in the current RAP<sub>Family</sub> and related DRCLs**, as demonstrated by international standards and guidance - *particularly for **planned exposure situations***.
- The DCRLs at higher taxonomic levels introduced in this publication offer the possibility of **more refined assessments along with a transparent evaluation of the level of confidence in the assessment conclusions**.
- This publication strengthens environmental radiological protection by broadening the RAP approach and improving the **scientific and methodological basis for benchmarks, thereby increasing confidence in impact assessments and protective decision-making**.
- The integration of the proposed methodology along with the existing RAP<sub>Family</sub> and related DCRLs is currently being examined further in the forthcoming publication on their application within the radiological protection system  
**“Considering the environment when applying the System of Radiological Protection Part 2:  
Integration within the system, including practical use of Derived Consideration Reference Levels”**
